CONTRACTING TRIANGLE

ELLIOTT CORRECTIONAL WAVES

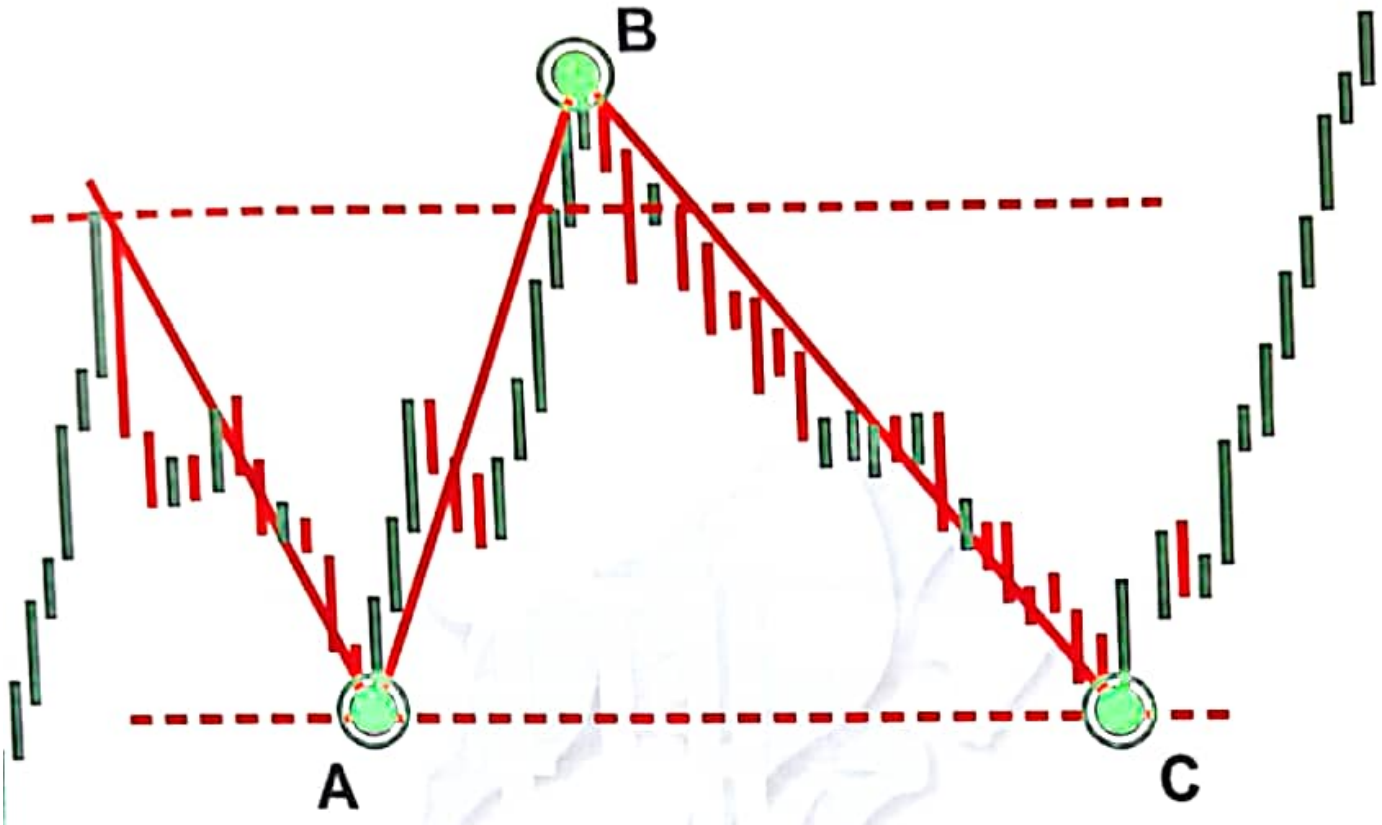

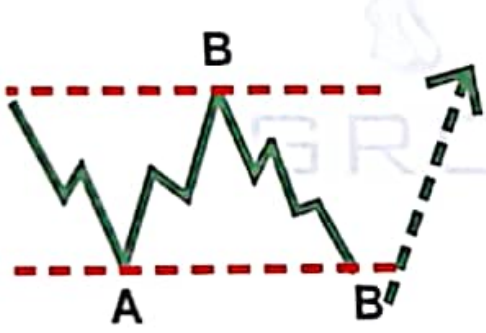

1. Contracting Triangle always subdivides into five waves,
2. Among waves A, B, C, D, and E, at least 4 subdivide into zigzags (3-3-3-3-3);
3. The distance traveled by each subsequent wave reduces in length.

EXPANDED FLAT

Elliott Correctional Waves

BULLISH

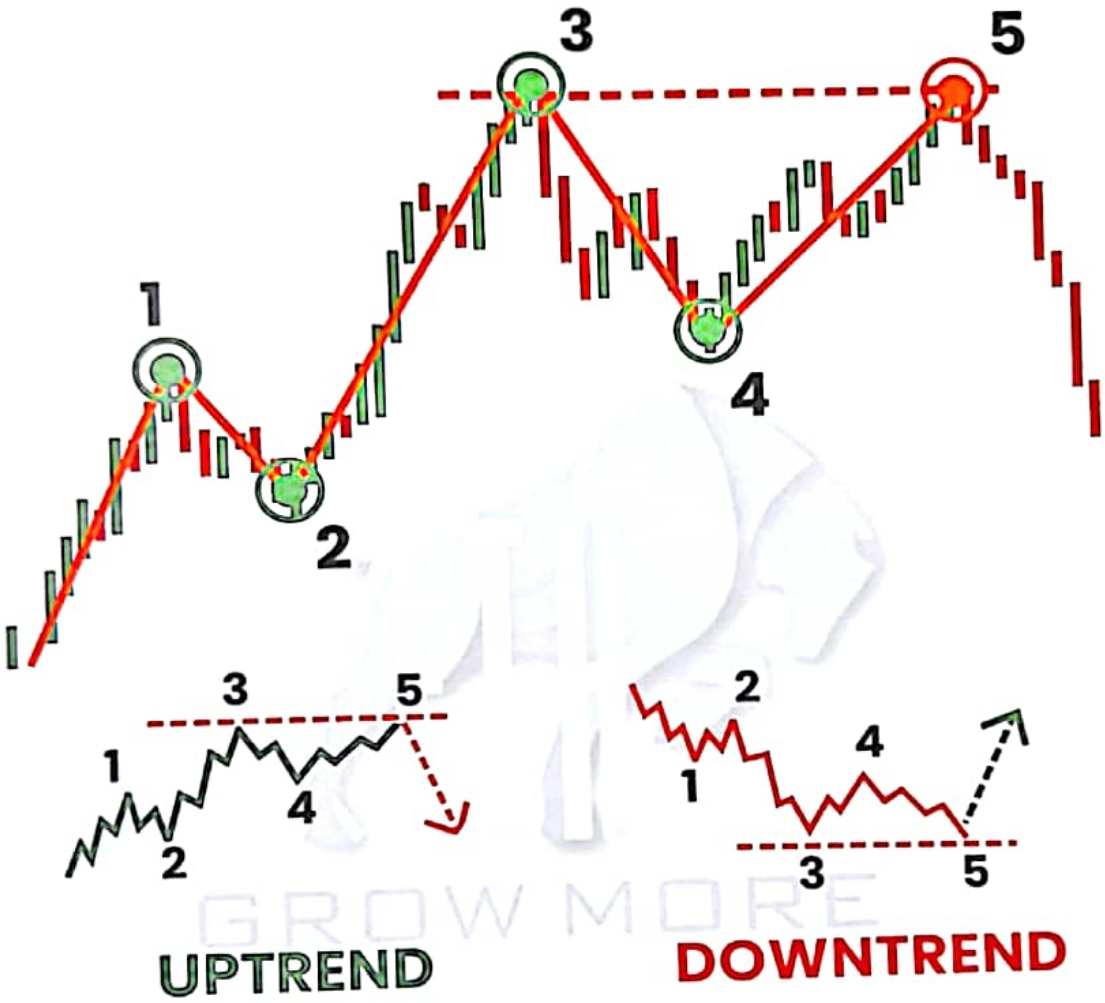

BEARISH

1. Expanded flat correction consists of three waves, A-B-C;
2. Waves A and B consist of three subwaves a-b-c;
3. Wave C includes five sub-waves 1-2-3-4-5;
4. Wave b retraces more than 100% of wave a;
5. Wave C retraces more than 100% of wave B.

TRUNCATED WAVE 5 ELLIOTT WAVES

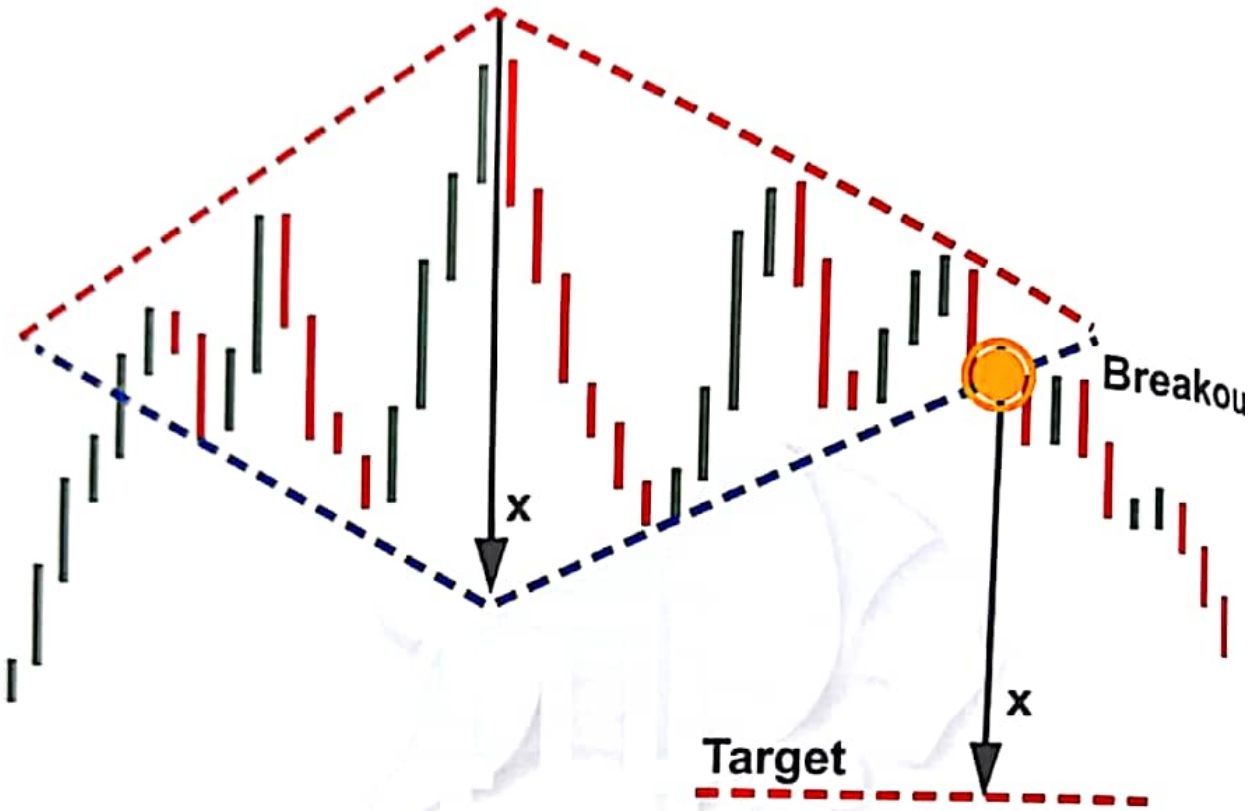

The A truncated Wave 5 occurs when it fails to overcome a resistance level of the Wave3.

This is a sign of the main trend weakening.

A truncated Wave 5 is often followed by a swift and sharp reversal

Scanned with OKEN Scanner

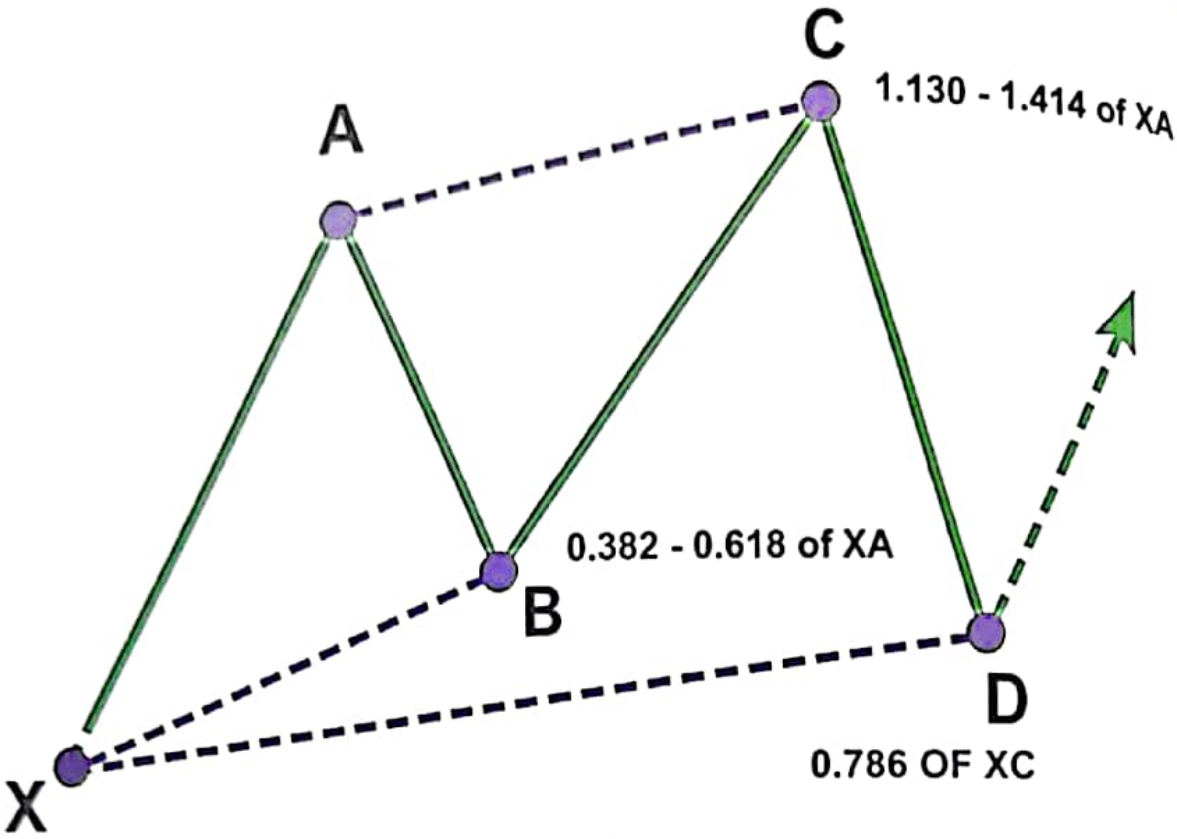

The Diamond top (bearish) and bottom (bullish) are reversa patterns.

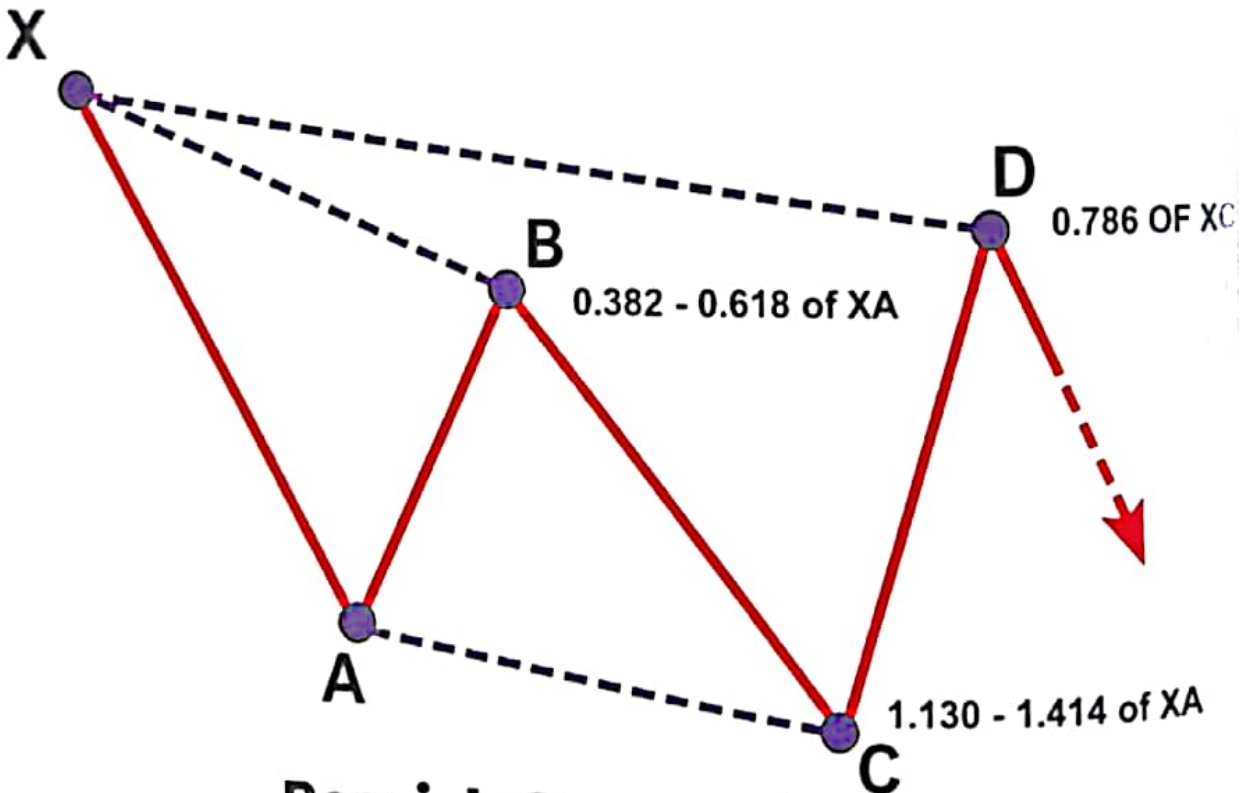

The pattern consists of two channels. The first one is broadening pattern where the price range increases in heigh and the second one is a triangle where the price range shrinks.

The target point is a distance between the highest an lowest point in the diamond formation added to the break-ou point.

TRIPLE BOTTOM

The The Triple Bottom is a bullish pattern characterized by three equal lows followed by a breakout above the resistance line.

The pattern shows that the buyers (bulls) take control of the price action from the sellers (bears). It forms as three roughly equal lows bouncing off the support level, followed by a breakout of the resistance level.

The triple bottom may indicate an opportunity to enter into a bullish trend.

ASCENDING TRIANGLE

Scanned with OKEN Scanner

A Rising Wedge Pattern is a reversal pattern (in an uptrend) or a trend continuation one (in a downtrend).

Characterized by higher highs and higher lows with a contracting range. The resistance and support lines slant up from left to right, but the lower line rises at a steeper angle than the upper one.

The volume keeps declining with each new price advance or waves up, indicating that the demand is weakening at the higher price level. After the breakout of the lower boundary line, the price usually declines.

INVERSE HEAD AND SHOULDERS

Inverse Head and Shoulders is a bullish form of the Head and Shoulders pattern. The pattern belongs to the trend reversal group.

It consists of a peak (Shoulder 1), followed by a higher peak (head), and another lower peak (Shoulder 2).

The target zone will be the distance between the neckline and the peak of the head.

DOUBLE BOTTOM

This is one of the trend reversal patterns.

It forms during the downtrend by a double price drop tothe same level.

The twice-touched low is considered a support level; the high is a resistance one.

After that, the price usually grows, breaks the top resistance level, and continues growing.

Scanned with OKEN Scanner

TRIPLE TOP

The triple top is a reversal pattern.

It appears in an uptrend when the price faces a strong resistance level.

When the price falls below the support level after the third maximum, the triple top pattern is considered complete, and traders expect a further downward movement.

Scanned with OKEN Scanner

ASCENDING TRIANGLE

Ascending Triangle is a trend continuation pattern.

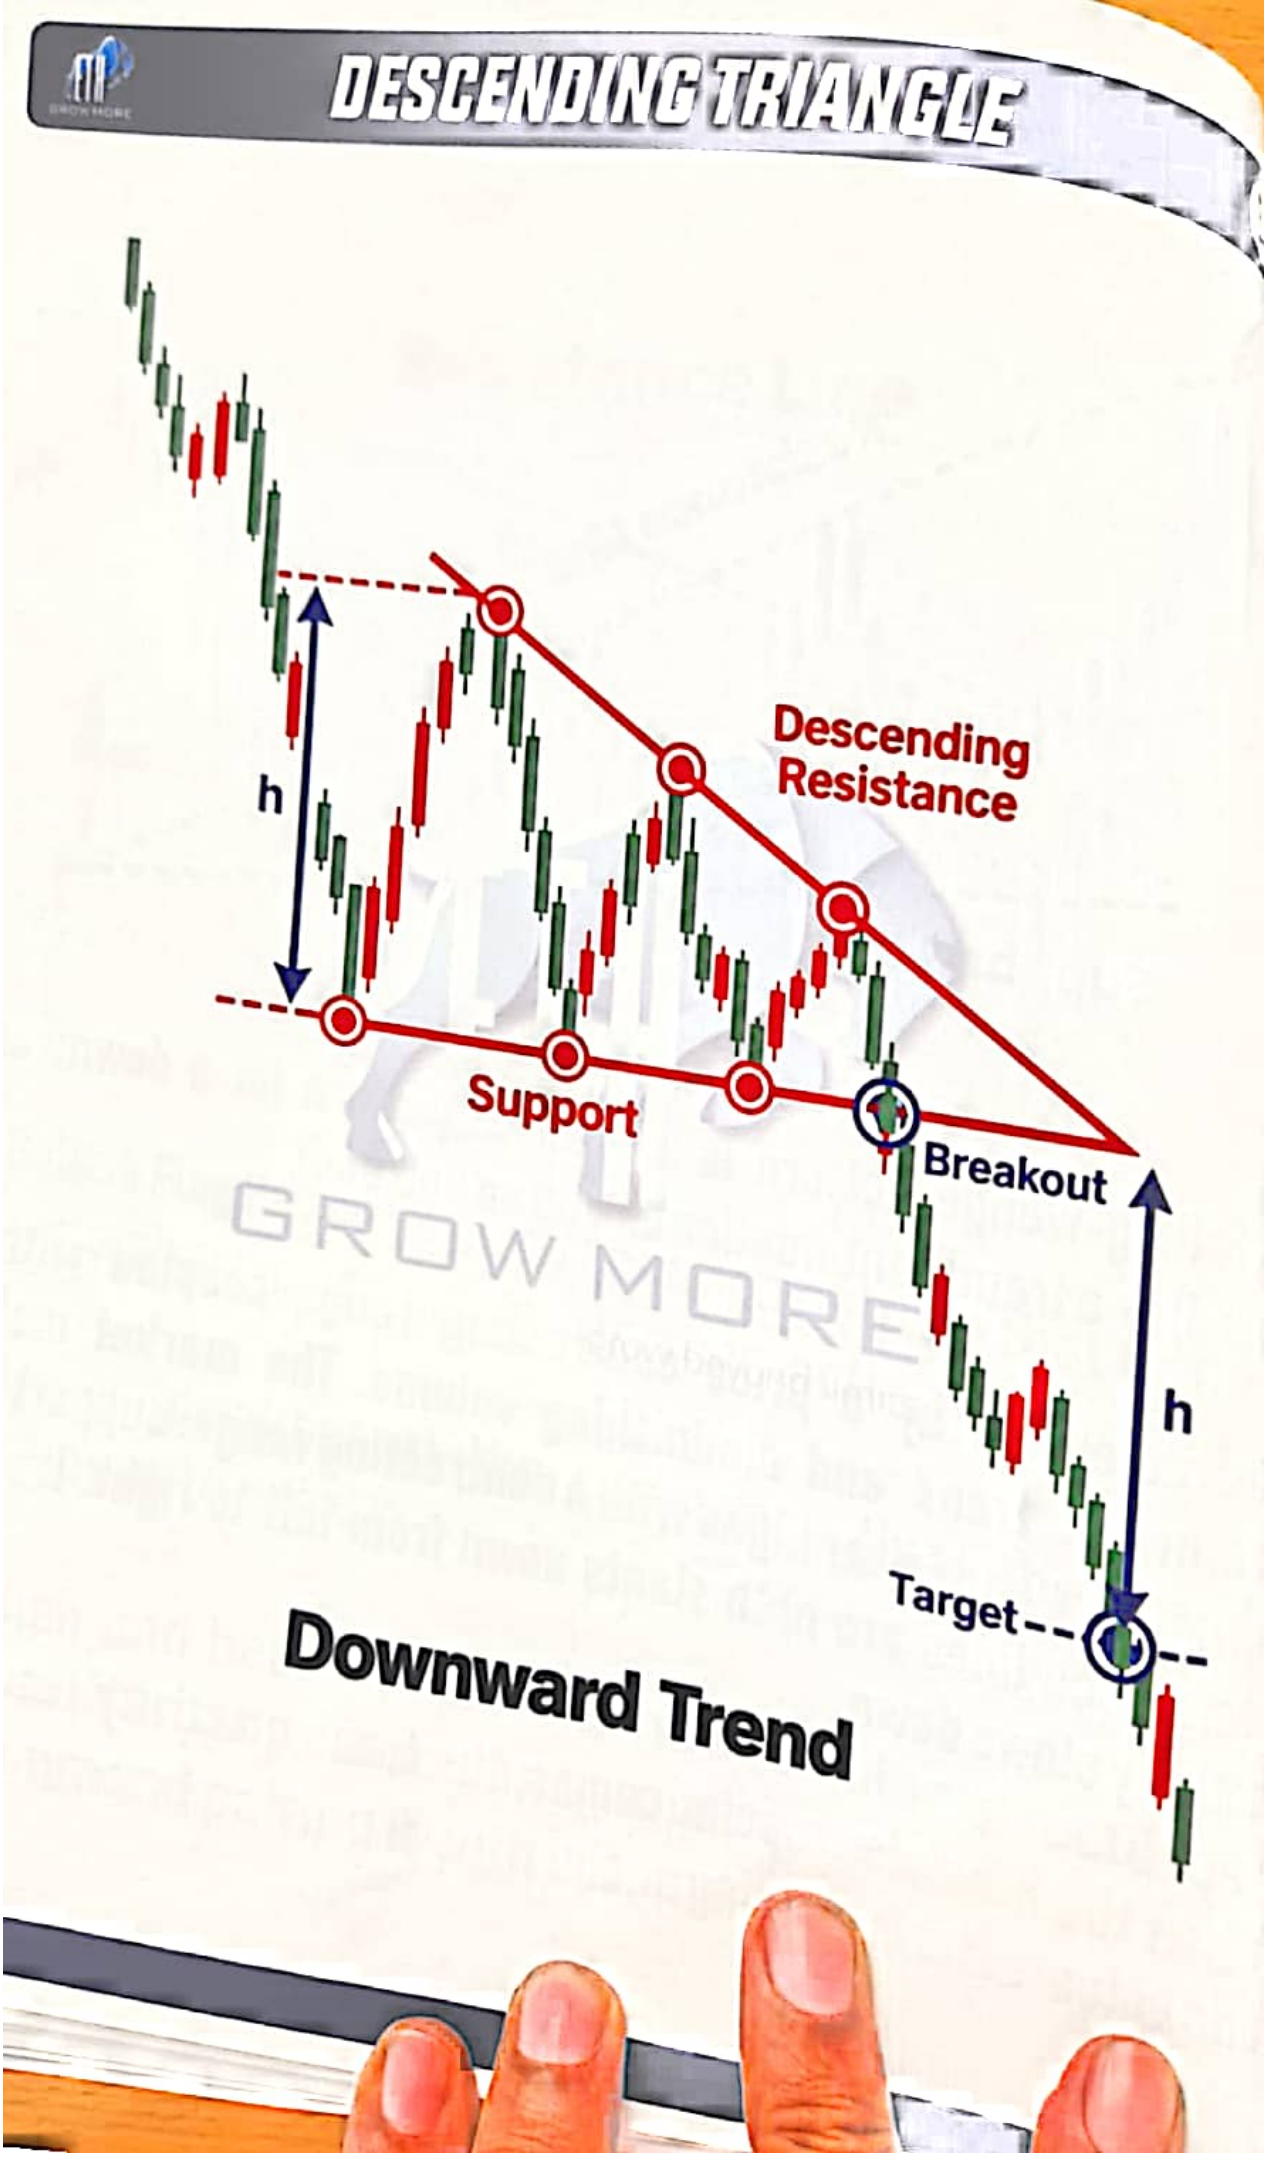

Formed by the strictly horizontal top resistance line and the bottom support line that ascends.

After the price breaks out the resistance line, the pattern is considered complete.

Its expected that the price will continue the upward trend

FALLING WEDGE

A Falling wedge pattern is a reversal pattern (in a downward trend) or a trend continuation one (in an uptrend).

Characterized by a price contracting range coupled with a downward trend and diminishing volume. The market makes lower lows and lower highs with a contracting range. Support and resistance lines are both slants down from left to right. Trading activity slows down.

When the breakdown point comes, the trading activity resume and volume starts growing again.

BULLISH FLAG PATTERN

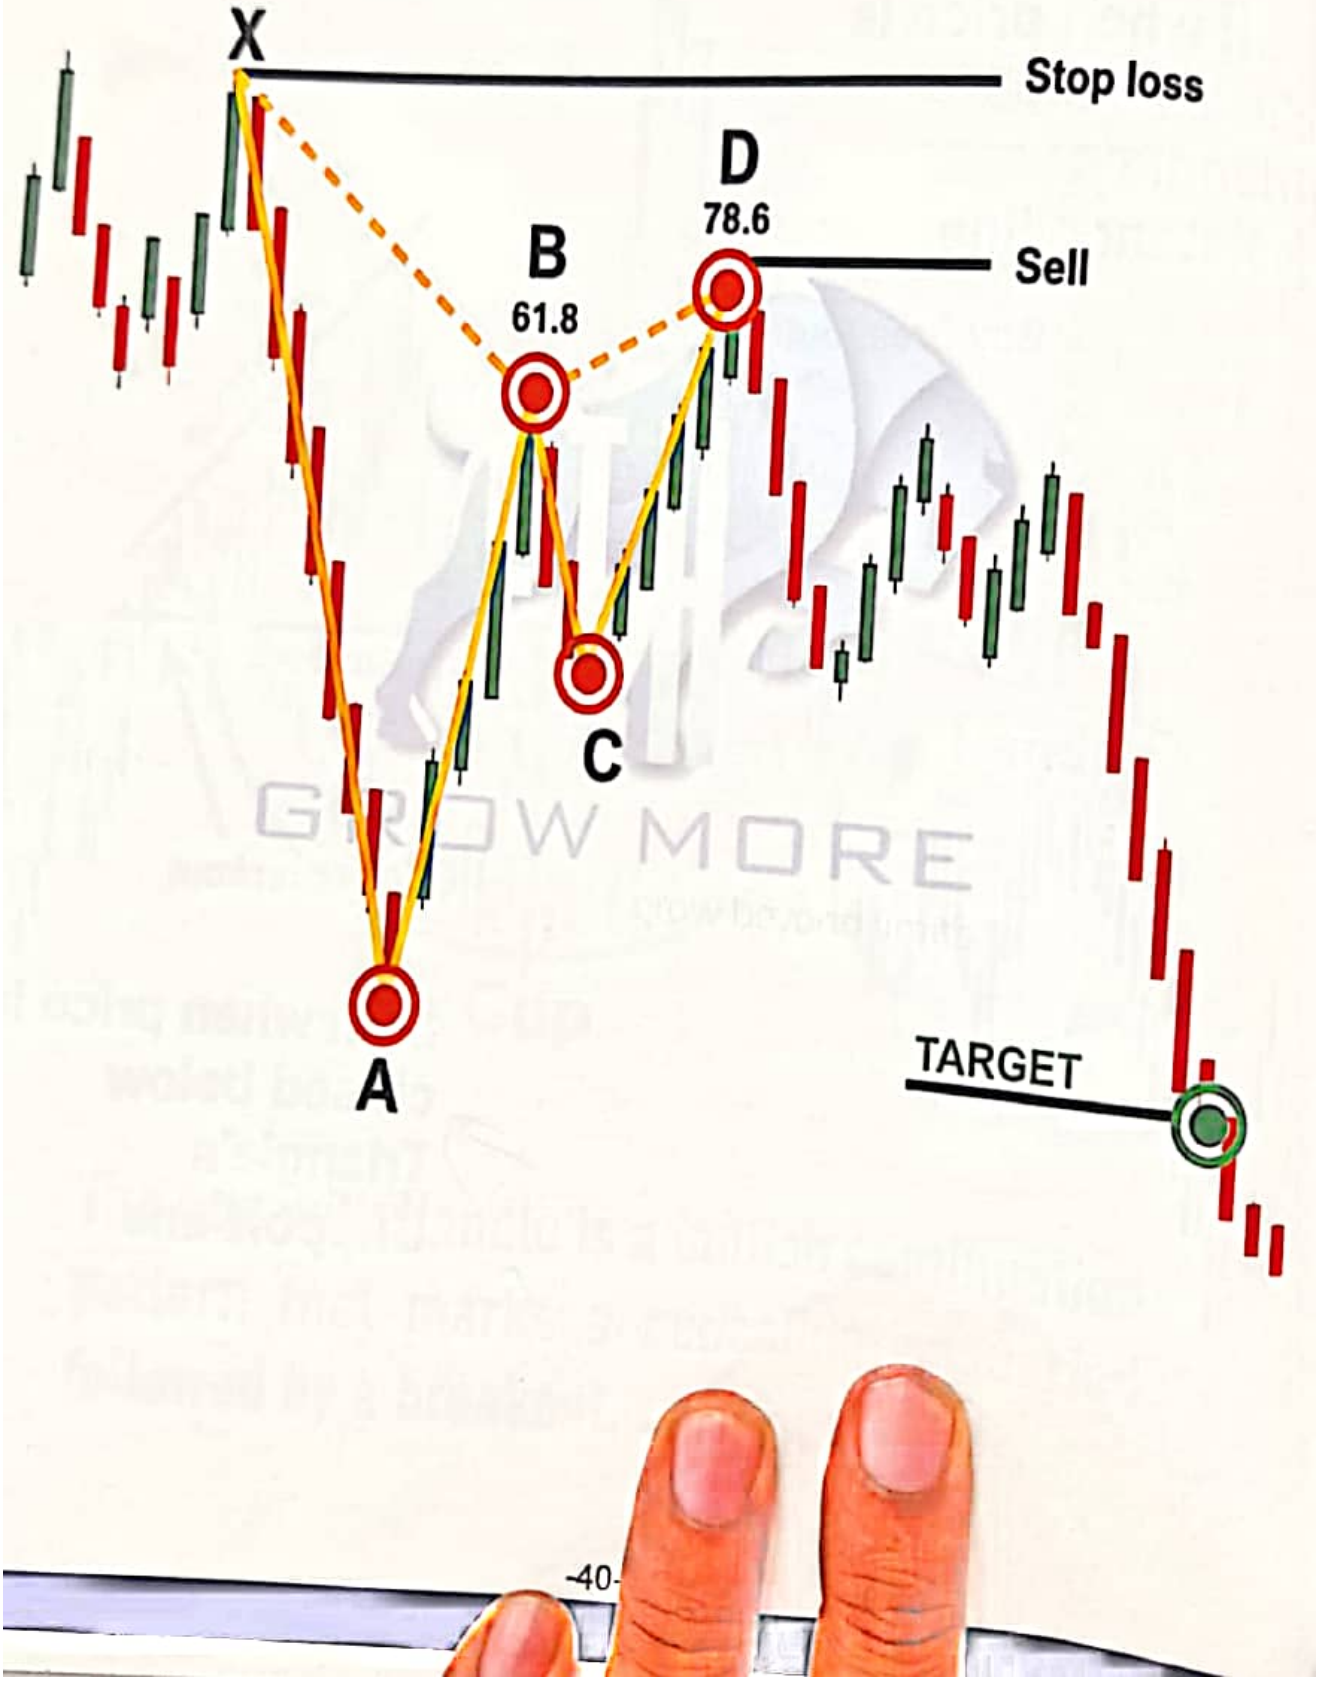

A Bullish Flag Pattern is a continuation pattern that forms after a sharp price growth as a correcting movement.

After a breakout of the resistance line, the trend continues to grow.

Bullish and bearish versions have similar structures but differ in directions and volumes. So we recommend pairing it with volume indicators.

ENTRY BY TREND LINES

Entry strategy by Trend Lines

Entry strategy by Trend Lines are fundamental tools used by technic analysts to identify support and resistance levels to build the tren channels.

The price shows a clear higher high and higher low movemen indicating a strong uptrend.

You can set up trend lines by hand or use automatic trend lin indicators to visualise the trend channels. This helps you to buy a support and take profit at resistance levels. In case the price break the support or resistance level you should be aware of a potentia trend breakout or reversal

BROADENING TRIANGLE

Broadening Triangle can be formed when the price creates new maximum and new minimum levels due to fast volatility. Despite that, it is a quite seldom pattern.

The pattern has two broadening borders between which the price moves. They are clearly visible when connecting the highs and lows with lines.

The direction of the breakout is difficult to predict because of the diverging nature of the pattern, so the false breakouts take place. Keep an on eye the volume levels and use technical indicators like the RSI to conduct analysis.

PENNANT PATTERN

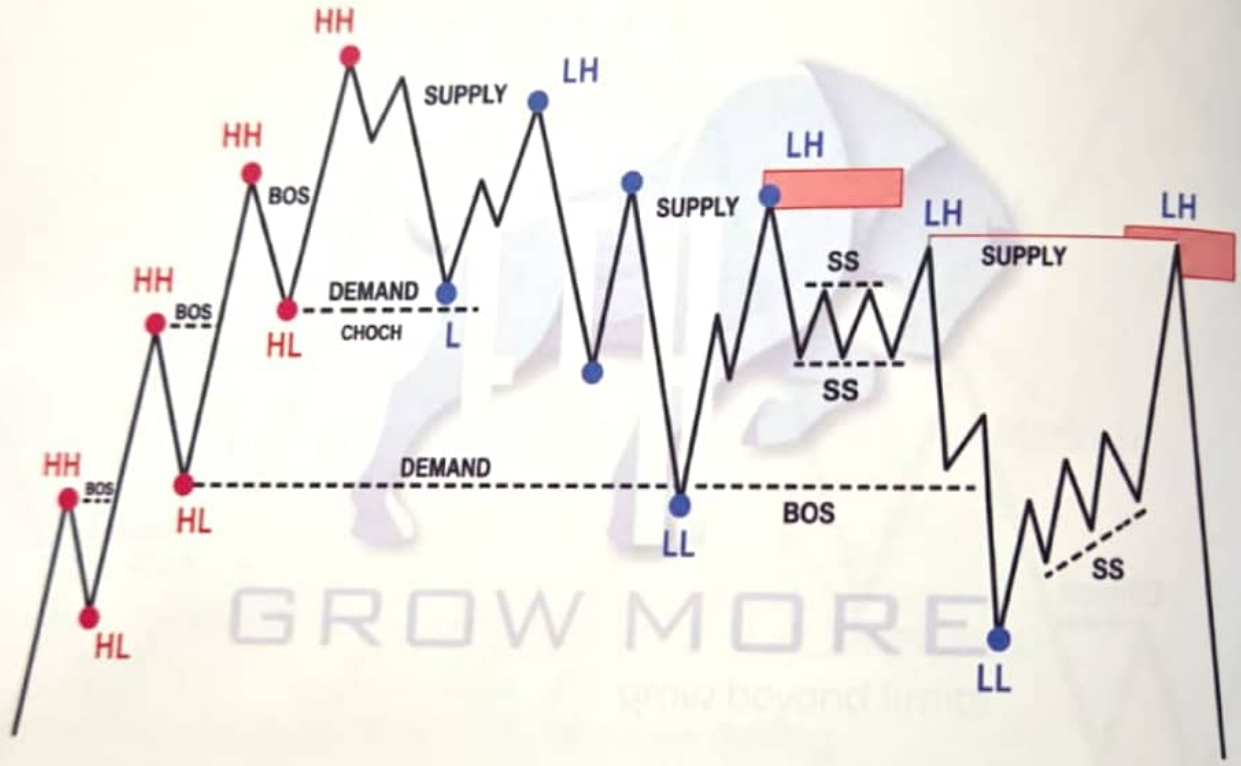

Pennant pattern refers to the continuation patterns.

It forms when there is a sharp price growth in the market (flag pole). Then the price slows down, moving into a consolidation phase with converging trend lines (pennant).

The breakout movement would be in the same direction as before the consolidation.

DOUBLE TOP PATTERN

Double Top is a reversal pattern usually formed after an extended uptrend. It has two peaks called the first and second Top.

The first Top is formed when the price bumps into a strong resistance level that can not be overcome. Then the price retreats to the support level and returns for the second time, creating a second top. After that, the price may drop sharply to break a neckline level and continue moving downward.

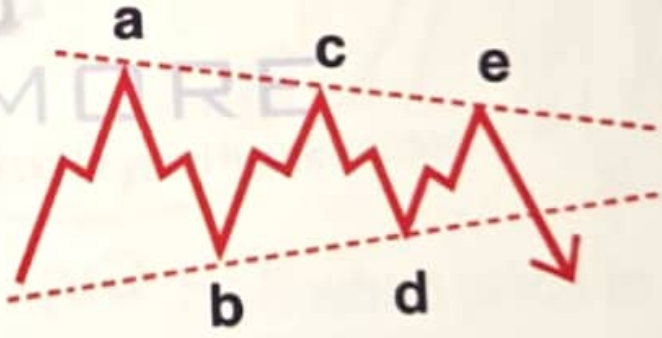

The target zone will be the distance between the tops and the neckline
